# 0.0.1 Section 1.2: Row Reduction and Echelon Forms

# Echelon form (or row echelon form):

- 1. All nonzero rows are above any rows of all zeros.
- 2. Each *leading entry* (i.e. left most nonzero entry) of a row is in a column to the right of the leading entry of the row above it.
- 3. All entries in a column below a leading entry are zero.

#### **EXAMPLE:** Echelon forms

**Reduced echelon form:** Add the following conditions to conditions 1, 2, and 3 above:

- 4. The leading entry in each nonzero row is 1.
- 5. Each leading 1 is the only nonzero entry in its column.

# **EXAMPLE** (continued):

Reduced echelon form :

$$\begin{bmatrix} 0 & 1 & * & 0 & 0 & * & * & 0 & 0 & * & * \\ 0 & 0 & 0 & 1 & 0 & * & * & 0 & 0 & * & * \\ 0 & 0 & 0 & 0 & 1 & * & * & 0 & 0 & * & * \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & * & * \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & * & * \end{bmatrix}$$

# Theorem 1 (Uniqueness of The Reduced Echelon Form):

Each matrix is row-equivalent to one and only one reduced echelon matrix.

# Important Terms:

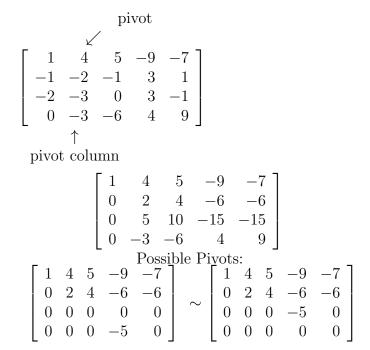

- **pivot position:** a position of a leading entry in an echelon form of the matrix.
- **pivot:** a nonzero number that either is used in a pivot position to create 0's or is changed into a leading 1, which in turn is used to create 0's.
- pivot column: a column that contains a pivot position.

(See the Glossary at the back of the textbook.)

**EXAMPLE:** Row reduce to echelon form and locate the pivot columns.

$$\begin{bmatrix}
0 & -3 & -6 & 4 & 9 \\
-1 & -2 & -1 & 3 & 1 \\
-2 & -3 & 0 & 3 & -1 \\
1 & 4 & 5 & -9 & -7
\end{bmatrix}$$

#### Solution

Original Matrix: 
$$\begin{bmatrix} 0 & -3 & -6 & 4 & 9 \\ -1 & -2 & -1 & 3 & 1 \\ -2 & -3 & 0 & 3 & -1 \\ 1 & 4 & 5 & -9 & -7 \end{bmatrix}$$
pivot columns: 
$$1 \quad 2 \qquad 4$$

**Note:** There is no more than one pivot in any row. There is no more than one pivot in any column.

**EXAMPLE:** Row reduce to echelon form and then to reduced echelon form:

$$\begin{bmatrix}
0 & 3 & -6 & 6 & 4 & -5 \\
3 & -7 & 8 & -5 & 8 & 9 \\
3 & -9 & 12 & -9 & 6 & 15
\end{bmatrix}$$

Solution:

$$\begin{bmatrix} 0 & 3 & -6 & 6 & 4 & -5 \\ 3 & -7 & 8 & -5 & 8 & 9 \\ 3 & -9 & 12 & -9 & 6 & 15 \end{bmatrix} \sim \begin{bmatrix} 3 & -9 & 12 & -9 & 6 & 15 \\ 3 & -7 & 8 & -5 & 8 & 9 \\ 0 & 3 & -6 & 6 & 4 & -5 \end{bmatrix}$$
$$\sim \begin{bmatrix} 3 & -9 & 12 & -9 & 6 & 15 \\ 0 & 2 & -4 & 4 & 2 & -6 \\ 0 & 3 & -6 & 6 & 4 & -5 \end{bmatrix}$$

Cover the top row and look at the remaining two rows for the left-most nonzero column.

$$\begin{bmatrix} 3 & -9 & 12 & -9 & 6 & 15 \\ 0 & 2 & -4 & 4 & 2 & -6 \\ 0 & 3 & -6 & 6 & 4 & -5 \end{bmatrix} \sim \begin{bmatrix} 3 & -9 & 12 & -9 & 6 & 15 \\ 0 & 1 & -2 & 2 & 1 & -3 \\ 0 & 3 & -6 & 6 & 4 & -5 \end{bmatrix}$$
$$\sim \begin{bmatrix} 3 & -9 & 12 & -9 & 6 & 15 \\ 0 & 1 & -2 & 2 & 1 & -3 \\ 0 & 0 & 0 & 0 & 1 & 4 \end{bmatrix}$$
 (echelon form)

#### Final step to create the reduced echelon form:

Beginning with the rightmost leading entry, and working upwards to the left, create zeros above each leading entry and scale rows to transform each leading entry into 1.

$$\begin{bmatrix} 3 & -9 & 12 & -9 & 0 & -9 \\ 0 & 1 & -2 & 2 & 0 & -7 \\ 0 & 0 & 0 & 0 & 1 & 4 \end{bmatrix} \sim \begin{bmatrix} 3 & 0 & -6 & 9 & 0 & -72 \\ 0 & 1 & -2 & 2 & 0 & -7 \\ 0 & 0 & 0 & 0 & 1 & 4 \end{bmatrix}$$
$$\sim \begin{bmatrix} 1 & 0 & -2 & 3 & 0 & -24 \\ 0 & 1 & -2 & 2 & 0 & -7 \\ 0 & 0 & 0 & 0 & 1 & 4 \end{bmatrix}$$

## SOLUTIONS OF LINEAR SYSTEMS

- basic variable: any variable that corresponds to a pivot column in the augmented matrix of a system.
- free variable: all nonbasic variables.

#### **EXAMPLE:**

$$\begin{array}{rcl}
x_1 & +6x_2 & +3x_4 & = 0 \\
x_3 & -8x_4 & = 5 \\
x_5 & = 7
\end{array}$$

pivot columns:

basic variables:

free variables:

Final Step in Solving a Consistent Linear System: After the augmented matrix is in **reduced** echelon form and the system is written down as a set of equations:

Solve each equation for the basic variable in terms of the free variables (if any) in the equation.

# **EXAMPLE:**

The **general solution** of the system provides a parametric description of the solution set. (The free variables act as parameters.) The above system has **infinitely many solutions**.

Why?

Warning: Use only the reduced echelon form to solve a system.

# Existence and Uniqueness Questions

## **EXAMPLE:**

$$\begin{bmatrix} 3x_2 & -6x_3 & +6x_4 & +4x_5 & = -5 \\ 3x_1 & -7x_2 & +8x_3 & -5x_4 & +8x_5 & = 9 \\ 3x_1 & -9x_2 & +12x_3 & -9x_4 & +6x_5 & = 15 \end{bmatrix}$$

In an earlier example, we obtained the echelon form:

$$\begin{bmatrix} 3 & -9 & 12 & -9 & 6 & 15 \\ 0 & 2 & -4 & 4 & 2 & -6 \\ 0 & 0 & 0 & 0 & 1 & 4 \end{bmatrix} \quad (x_5 = 4)$$

No equation of the form 0 = c, where  $c \neq 0$ , so the system is consistent. **Free variables:**  $x_3$  and  $x_4$ 

Consistent system with free variables  $\implies$  infinitely many solutions.

## **EXAMPLE:**

$$3x_{1} +4x_{2} = -3$$

$$2x_{1} +5x_{2} = 5$$

$$-2x_{1} -3x_{2} = 1$$

$$\begin{bmatrix} 3 & 4 & -3 \\ 2 & 5 & 5 \\ -2 & -3 & 1 \end{bmatrix}$$

$$\sim \begin{bmatrix} 3 & 4 & -3 \\ 0 & 1 & 3 \\ 0 & 0 & 0 \end{bmatrix} \longrightarrow \begin{cases} 3x_{1} + 4x_{2} = -3 \\ x_{2} = 3 \end{cases}$$

Consistent system, no free variables

 $\implies$  unique solution.

# Theorem 2 (Existence and Uniqueness Theorem)

1. A linear system is consistent if and only if the rightmost column of the augmented matrix is not a pivot column, i.e., if and only if an echelon form of the augmented matrix has no row of the form

$$\begin{bmatrix} 0 & \dots & 0 & b \end{bmatrix}$$
 (where  $b$  is nonzero).

- 2. If a linear system is consistent, then the solution contains either
  - (i) a unique solution (when there are no free variables) or
- (ii) infinitely many solutions (when there is at least one free variable).

# Using Row Reduction to Solve Linear Systems

- 1. Write the augmented matrix of the system.
- 2. Use the row reduction algorithm to obtain an equivalent augmented matrix in echelon form. Decide whether the system is consistent. If not, stop; otherwise go to the next step.
  - 3. Continue row reduction to obtain the reduced echelon form.
- 4. Write the system of equations corresponding to the matrix obtained in step 3.
- 5. State the solution by expressing each basic variable in terms of the free variables and declare the free variables.

#### **EXAMPLE:**

- a) What is the largest possible number of pivots a  $4 \times 6$  matrix can have? Why?
- b) What is the largest possible number of pivots a  $6 \times 4$  matrix can have? Why?
- c) How many solutions does a consistent linear system of 3 equations and 4 unknowns have? Why?
- d) Suppose the coefficient matrix corresponding to a linear system is  $4\times6$  and has 3 pivot columns. How many pivot columns does the augmented matrix have if the linear system is inconsistent?
