# General second order equations

Math 23, Spring  
2007

Scott Pauls

The most general linear second order equation is of the form:

$$y'' + p(t)y' + q(t)y = g(t)$$

We often write this in operator notation:

$$L = \frac{d^2}{dt^2} + p(t)\frac{d}{dt} + q(t)$$

Then the ODE becomes

$$L(y(t)) = g(t)$$

## Theorem

*Consider the initial value problem*

$$y'' + p(t)y' + q(t)y = g(t), \quad y(t_0) = y_0, \quad y'(t_0) = y'_0$$

*where  $p$ ,  $q$  and  $g$  are continuous on an open interval  $I$  that contains the point  $t_0$ . Then there is exactly one solution  $y = \phi(t)$  of this problem, and the solution exists throughout the interval  $I$ .*

# Linear homogeneous second order equations

## The principle of superposition

### Theorem

*If  $y_1$  and  $y_2$  are solutions to  $L[y] = 0$  then any linear combination of  $y_1$  and  $y_2$  is also a solution.*

Q: Will this be enough to find the unique solution if  $L$  satisfies the conditions of the existence and uniqueness theorem?

## Theorem

*If  $y_1$  and  $y_2$  are solutions to  $L[y] = 0$  then any linear combination of  $y_1$  and  $y_2$  is also a solution.*

Q: Will this be enough to find the unique solution if  $L$  satisfies the conditions of the existence and uniqueness theorem?

# Linear homogeneous second order equations

Math 23, Spring  
2007

Scott Pauls

To answer this we rewrite

$$\begin{aligned}c_1 y_1(t_0) + c_2 y_2(t_0) &= y_0 \\c_1 y_1'(t_0) + c_2 y_2'(t_0) &= y_0'\end{aligned}$$

in matrix form:

$$\begin{pmatrix} y_1(t_0) & y_2(t_0) \\ y_1'(t_0) & y_2'(t_0) \end{pmatrix} \begin{pmatrix} c_1 \\ c_2 \end{pmatrix} = \begin{pmatrix} y_0 \\ y_0' \end{pmatrix}$$

We know that there is a unique solution  $\{c_1, c_2\}$  if

$$\det \begin{pmatrix} y_1(t_0) & y_2(t_0) \\ y_1'(t_0) & y_2'(t_0) \end{pmatrix} = y_1(t_0)y_2'(t_0) - y_2(t_0)y_1'(t_0) \neq 0$$

# Linear homogeneous first order equations

## The Wronskian

$$W(y_1, y_2, t_0) = y_1(t_0)y_2'(t_0) - y_2(t_0)y_1'(t_0)$$

is called the Wronskian.

### Theorem

*Suppose that  $y_1$  and  $y_2$  are solutions to  $L[y] = 0$  and  $W(y_1, y_2, t_0) \neq 0$ . Then, the initial value problem*

$$L[y] = 0, y(t_0) = y_0, y'(t_0) = t'_0$$

*has a unique solution.*

### Corollary

*If the characteristic equation of a second order linear homogeneous constant coefficient ODE has distinct real roots. Then an associated initial value problem of this form has a unique solution.*

# Linear homogeneous first order equations

## The Wronskian

$$W(y_1, y_2, t_0) = y_1(t_0)y_2'(t_0) - y_2(t_0)y_1'(t_0)$$

is called the Wronskian.

## Theorem

Find the Wronskian of the following functions:

1.

$$e^{2t}, e^{-3t/2}$$

2.

$$e^t \sin(t), e^t$$

3.

$$\cos(\theta)^2, 1 + \cos(2\theta)$$

At which points are the Wronskians nonzero (i.e. at which points do these functions form a fundamental set of solutions)?
