range?
```

**Type:** <type 'builtin\_function\_or\_method'>

**Definition:** range( [noargspec] )

**Docstring:**

range(stop) -> list of integers  
range(start, stop[, step]) -> list of integers

Return a list containing an arithmetic progression of integers.  
range(i, j) returns [i, i+1, i+2, ..., j-1]; start (!) defaults to 0.  
When step is given, it specifies the increment (or decrement).  
For example, range(4) returns [0, 1, 2, 3]. The end point is omitted!  
These are exactly the valid indices for a list of 4 elements.
